

## # API Data Display HTML Readme

This HTML code is a basic web page that is designed for displaying cricket-score of different current matches fetched from an API. Below is a simple description of the code and its components.

I have developed a front-end for a website which intends to show live time cricket related information and upcoming matches.

I fetched this whole data from “Cric API” in which match-id, name, status, time and date of the match, team names etc.

I have created buttons for each and every match related data coming from the API server to display the same on a pop-up bar.

### ## File Structure

- mainstyle.css: An external stylesheet for styling the web page.
- app.js: JavaScript file responsible for handling API requests, search functionality, and modal display.
- AboutStyle.css : which is being used to design About.html file
- contactStyle.css : which is being used to design Contact.html file
- main.html: Link to the Home page.
- About.html: Link to the About page.
- Contact.html: Link to the Contact page.
- README.md: This readme file.

To run the web-page extract all the files including all the logos and images from zip folder in a documentary and run main.html.
